

Edge attributes and performance measures

Supply Chain Edge Attributes		
Sr	Attribute/Feature	Description
1	Link distance	Distance between two nodes (typically by road)
2	Transportation Type	Mode of transport (e.g., Road, Air)
3	Lead Time	Time to deliver the shipment from one node to another
4	Product(s)	List of products (SKUs) that are being transported
5	Max load capacity	Maximum quantity that can be shipped
6	Min shipment quantity	Minimum quantity required to start a shipment
7	Transportation cost	Cost to transport goods from one node to another in the SC
8	Prob of link failure/unavailability	Probability of this link being unavailable due to natural disasters, road maintenance, or road blocks (e.g., rallies)
Supply Chain Edge Performance Measures		
Sr	Performance Measure	Description
1	Material Flow	Quantity of product units transported over the link in a given time period
2	CO2 cost	Cost associated with carbon emissions from transportation
3	Link utilization	Utilization rate of the transportation link (e.g., % usage vs. capacity)
4	Total Shipments	Number of shipments sent or received over the link
5	Edge resilience	Resilience depends on the reliability of the edge and connected nodes
6	Edge criticality	Refers to the importance of the edge
